 - **PathFinding** (Section 26, p. 49)
 - * **AStarNodeTests** (Section 27, p. 50)
 - * **heuristicTests** (Section 28, p. 52)
 - * **nodeTests** (Section 29, p. 54)
 - * **pathFindingTests** (Section 30, p. 56)
 - **files** (Section 31, p. 59)

1.2 Variables

Name	Description
<code>__package__</code>	Value: None

2 Package UnblockMeSolver.Map

2.1 Modules

- **Map** (Section 3, p. 4)
- **MapReader** (Section 4, p. 9)
- **Move** (Section 5, p. 11)
- **Piece** (Section 6, p. 14)

2.2 Variables

Name	Description
<code>--package--</code>	Value: None

3 Module UnblockMeSolver.Map.Map

3.1 Variables

Name	Description
<code>--package--</code>	Value: <code>'UnblockMeSolver.Map'</code>

3.2 Class Map

3.2.1 Methods

`__init__(self, graph, delimiter='\n')`

Initialize the class by setting the graph and delimiters variables.

Parameters

graph: Represents the board that the game will be played on
(*type=string | MapReader*)

delimiter: how to split the string
(*type=string*)

Overrides: `object.__init__`

`convertToMap(self)`

Convert the graph into a matrix that can be viewed and modified.

`setUpPieces(self)`

Find every piece available in the board and add it to an array to keep track of them for future use.

`setUp(self)`

Set up the Map class and set the graph by either getting a a string from either a map reader or string as the graph and breaking if not valid.

isWallOrGoal(*self, point, num_goals_found*)

This will check if the point is a wall or goal and if not return False. Additionally, it will update the number of goals that have been found.

Parameters

point: the point being checked in the graph.
(type=character)

num_goals_found: number of goals in the graph currently found
(type=integer)

Return Value

if the point is a wall or a goal and number of goals currently found
(type=boolean, integer)

largeRowValid(*self, row_index, num_goals_found*)

This will test on the larger rows to see if it is valid. A larger row indicates that it is either the top or the bottom of the graph.

Parameters

row_index: index for the row to be checked
(type=integer)

num_goals_found: the number of goals that have been found
(type=integer)

Return Value

If a large row provided is valid and number of goals currently found
(type=boolean, integer)

numColumnsMatch(*self*)

Ensure that the number of columns matches for each row.

Return Value

if the number of columns matches for each row
(type=boolean)

topBottomRowsValid(*self, num_goals_found*)

Make sure that both the top and bottom rows are valid according to the topBottomRowsValid function.

Parameters

num_goals_found: number of goals presently found
(type=integer)

Return Value

If the top and bottom rows are valid and number of goals currently found
(type=boolean, integer)

midRowsValid(*self*, *num_goals_found*)

Ensure that all the middle rows are valid entries with walls or a goal on both sides.

Parameters

num_goals_found: number of goals presently found
(*type=integer*)

Return Value

if the middle rows are valid and the number of goals currently found
(*type=boolean, integer*)

playerFound(*self*)

Check to see if the player, defined in Map.py, is in the map.

Return Value

player found in map
(*type=boolean*)

isValid(*self*)

Test if the graph in the map class is valid or not.

Return Value

graph is valid or not
(*type=boolean*)

validAdditionMoves(*self*, *move*)

This will handle move verificatin for moving to the right or down in the board. It will return an array of the the moves that can be made in the direction given.

Parameters

move: Array of moves in the direction of the move given
(*type=[Move]*)

validSubtractionMoves(*self*, *move*)

This will handle move verificatin for moving to the left or up in the board. It will return an array of the the moves that can be made in the direction given.

Parameters

move: Array of moves in the direction of the move given
(*type=[Move]*)

isValidMove(*self*, *move*)

Check if the move given is valid or not to make the move.

Return Value

if the move is valid or not
(*type=boolean*)

makeConfidentMove(*self*, *move*)

Make a move on the board without checking for its validity.

Parameters

move: move to make on the board
(*type=Move*)

makeMove(*self*, *move*)

Make a move on the board. Raise syntax error on bad move given

Parameters

move: move to make on the board
(*type=Move*)

getMoves(*self*)

Get the moves available on the board.

Return Value

Array of moves available
(*type=[Move]*)

isSolved(*self*)

If there is a goal found then the board is not solved. Complete checking is done as there may be a goal in any location.

Return Value

if the game has been solved or not
(*type=boolean*)

copy(*self*)

Create a copy of this map and return it

Return Value

Copy of this map
(*type=Map*)

copyMove(*self*, *move*)

Create a copy of the map and make a move on it; return the result.

Parameters

move: move to be made on copied board
(*type=Move*)

Return Value

The new map with the move made on it
(*type=Map*)

copyConfidentMove(*self*, *move*)

Create a copy of the map and make a move on it without checking for its validity. Return the result.

Parameters

move: move to be made on copied board
(*type=Move*)

Return Value

The new map with the move made on it
(*type=Map*)

Inherited from object

`__delattr__()`, `__format__()`, `__getattr__()`, `__hash__()`, `__new__()`, `__reduce__()`, `__reduce_ex__()`, `__repr__()`, `__setattr__()`, `__sizeof__()`, `__str__()`, `__subclasshook__()`

3.2.2 Properties

<i>Inherited from object</i>	
<code>__class__</code>	

3.2.3 Class Variables

Name	Description
wall	Value: ' '
goal	Value: '\$'
empty	Value: '0'
player	Value: '**'
playerPiece	Value: '*'

4 Module UnblockMeSolver.Map.MapReader

4.1 Variables

Name	Description
<code>--package--</code>	Value: <code>'UnblockMeSolver.Map'</code>

4.2 Class MapReader

4.2.1 Methods

<code>--init--(self)</code>
Initialize MapReader class
Overrides: <code>object.--init--</code>

<code>load(self, file_name)</code>
Set flags and test if the file given exists. Throws IOError on file not existing.
Parameters
<code>file_name</code>: Name of the file that contains definition of the map.
<i>(type=string)</i>

<code>get(self)</code>
Read the file and return the string inside
Return Value
string inside of the specified file
<i>(type=string)</i>

Inherited from object

`--delattr--()`, `--format--()`, `--getattr--()`, `--hash--()`, `--new--()`, `--reduce--()`, `--reduce_ex--()`,
`--repr--()`, `--setattr--()`, `--sizeof--()`, `--str--()`, `--subclasshook--()`

4.2.2 Properties

Name	Description
<i>Inherited from object</i> __class__	

4.2.3 Class Variables

Name	Description
loaded	Value: False
file_found	Value: False

5 Module UnblockMeSolver.Map.Move

5.1 Variables

Name	Description
<code>--package--</code>	Value: None

5.2 Class Move

5.2.1 Methods

<code>--init--</code> (<i>self</i> , <i>piece</i> , <i>right</i> , <i>up</i>)
Initialize data structure with required variables. Throws an error on incorrect value ranges and types given
Parameters
<i>piece</i> : The piece to be moved (<i>type=character</i>)
<i>right</i> : If the piece should be to the right by a space (<i>type=integer</i>)
<i>up</i> : If the piece should be moved up by a space (<i>type=integer</i>)
Overrides: <code>object.--init--</code>

<code>isValid</code> (<i>self</i>)
Ensure that the move is valid for the board and the piece is a character.

equals(*self*, *move*)

Test whether the two moves are equal.

Parameters

move: Move being tested for equality
(*type=Move*)

Return Value

Whether the two moves are equal
(*type=boolean*)

toStr(*self*)

Convert self to string.

Return Value

String representation of the move
(*type=str*)

left(*piece*, *size=1*)

Instantiate a move that will go left

Parameters

piece: Character that represents the piece to be moved
(*type=character*)

right(*piece*, *size=1*)

Instantiate a move that will go right

Parameters

piece: Character that represents the piece to be moved
(*type=character*)

up(*piece*, *size=1*)

Instantiate a move that will go up

Parameters

piece: Character that represents the piece to be moved
(*type=character*)

down (<i>piece</i> , <i>size=1</i>)
--

Instantiate a move that will go down

Parameters

<p> piece: Character that represents the piece to be moved <i>(type=character)</i> </p>

Inherited from object

6 Module UnblockMeSolver.Map.Piece

6.1 Variables

Name	Description
<code>--package--</code>	Value: <code>'UnblockMeSolver.Map'</code>

6.2 Class Piece

6.2.1 Methods

<code>--init--</code> <i>(self, x, y, vertical)</i>
Initialize piece class
Parameters
x: x coordinate <i>(type=integer)</i>
y: y coordinate <i>(type=integer)</i>
vertical: marks whether this piece can move vertically or not <i>(type=boolean)</i>
Overrides: <code>object.--init--</code>

<code>move</code> <i>(self, move)</i>
Move the piece if the given move is valid
Parameters
move: Move that will change the location of the piece <i>(type=Move)</i>

copy (<i>self</i>)

Create a copy of self.

Return Value

Copy of this piece

<i>(type=Piece)</i>

Inherited from object

`__delattr__()`, `__format__()`, `__getattr__()`, `__hash__()`, `__new__()`, `__reduce__()`, `__reduce_ex__()`,
`__repr__()`, `__setattr__()`, `__sizeof__()`, `__str__()`, `__subclasshook__()`

- **dfs** (*Section 16, p. 31*)

7.2 Variables

Name	Description
<code>--package--</code>	Value: None

8 Module UnblockMeSolver.PathFinder.AStar

8.1 Variables

Name	Description
<code>--package--</code>	Value: <code>'UnblockMeSolver.PathFinder'</code>

8.2 Class AStar

object 

UnblockMeSolver.PathFinder.PathFinder.PathFinder

UnblockMeSolver.PathFinder.AStar.AStar

8.2.1 Methods

populateQueue (<i>self</i> , <i>graph</i> , <i>queue</i> , <i>parent</i>)
Populate the priority queue with nodes and their cost.
Parameters
graph: Graph to get moves from to populate queue (<i>type</i> = <i>Map</i>)
queue: Queue with nodes being added to it with the cost (<i>type</i> = <i>Queue</i>)
parent: Parent for the nodes that will be created (<i>type</i> = <i>AStarNode</i>)

getPath (<i>self</i> , <i>heuristic</i>)
Get the best path to solve the given graph.
Return Value
Array of moves which represent the path found to solve the puzzle (<i>type</i> = <i>[Move]</i>)
Overrides: UnblockMeSolver.PathFinder.PathFinder.PathFinder.getPath

Inherited from UnblockMeSolver.PathFinder.PathFinder.PathFinder(Section 12.2)

`__init__()`

Inherited from object

`__delattr__()`, `__format__()`, `__getattr__()`, `__hash__()`, `__new__()`, `__reduce__()`, `__reduce_ex__()`, `__repr__()`, `__setattr__()`, `__sizeof__()`, `__str__()`, `__subclasshook__()`

8.2.2 Properties

Name	Description
<i>Inherited from object</i>	
<code>__class__</code>	

9 Module UnblockMeSolver.PathFinder.AStarNode

9.1 Variables

Name	Description
<code>--package--</code>	Value: <code>'UnblockMeSolver.PathFinder'</code>

9.2 Class AStarNode

object

UnblockMeSolver.PathFinder.Node.Node

UnblockMeSolver.PathFinder.AStarNode.AStarNode

9.2.1 Methods

```
--init--(self, graph, move, parent, g, h)
```

Initialize AStarNode class

Parameters

graph: Map that moves can be made on
(*type=Map*)

move: Move that resulted in the above graph
(*type=Move*)

parent: Parent node of this. Contains previous moves to get the current board.
(*type=AStarNode*)

g: Step cost for this node
(*type=number*)

h: Heuristic cost for this node
(*type=number*)

Overrides: `object.__init__`

cost(<i>self</i>) <hr/> Cost for this node. Return Value The cost to get to this state (<i>type=number</i>)

Inherited from UnblockMeSolver.PathFinder.Node.Node(Section 11.2)

reconstructPath()

Inherited from object

__delattr__(), __format__(), __getattr__(), __hash__(), __new__(), __reduce__(), __reduce_ex__(),
__repr__(), __setattr__(), __sizeof__(), __str__(), __subclasshook__()

9.2.2 Properties

Name	Description
<i>Inherited from object</i>	
__class__	

9.2.3 Class Variables

Name	Description
g	Value: 0
h	Value: 0

10 Module `UnBlockMeSolver.PathFinder.Heuristics`

10.1 Functions

<code>manhattan($x1$, $y1$, $x2$, $y2$)</code>
--

<code>euclidian($x1$, $y1$, $x2$, $y2$)</code>
--

10.2 Variables

Name	Description
<code>--package--</code>	Value: <code>'UnBlockMeSolver.PathFinder'</code>

11 Module UnblockMeSolver.PathFinder.Node

11.1 Variables

Name	Description
<code>--package--</code>	Value: None

11.2 Class Node

object —
 UnblockMeSolver.PathFinder.Node.Node

Known Subclasses: UnblockMeSolver.PathFinder.AStarNode.AStarNode

11.2.1 Methods

<code>--init--(self, graph, move, parent)</code> <hr/> Initialize AStarNode class Parameters graph: Map that moves can be made on (<i>type=Map</i>) move: Move that resulted in the above graph (<i>type=Move</i>) parent: Parent node of this. Contains previous moves to get the current board. (<i>type=Node</i>) Overrides: object. <code>--init--</code>
<code>reconstructPath(self)</code> <hr/> Construct the path from here that it took to make it here. Return Value array of moves to get to this point from the root node (<i>type=[Move]</i>)

Inherited from object

`--delattr--()`, `--format--()`, `--getattr--()`, `--hash--()`, `--new--()`, `--reduce--()`, `--reduce_ex--()`,
`--repr--()`, `--setattr--()`, `--sizeof--()`, `--str--()`, `--subclasshook--()`

11.2.2 Properties

Name	Description
<i>Inherited from object</i>	
<code>--class--</code>	

12 Module *UnBlockMeSolver.PathFinder.PathFinder*

12.1 Variables

Name	Description
<code>--package--</code>	Value: None

12.2 Class *PathFinder*

object — ***UnBlockMeSolver.PathFinder.PathFinder.PathFinder***

Known Subclasses: *UnBlockMeSolver.PathFinder.TreeSearch.TreeSearch*, *UnBlockMeSolver.PathFinder.AStar.AStar*, *UnBlockMeSolver.PathFinder.dfs.DFS*, *UnBlockMeSolver.PathFinder.bfs*

12.2.1 Methods

<code>--init--</code> (<i>self</i> , <i>board</i>)
Initialize Pathfinder class instance.
Parameters
<i>board</i> : board to be solved
(<i>type=Map</i>)
Overrides: <i>object.--init--</i>

<code>getPath</code> (<i>self</i>)
Get the best path to solve the given graph.
Return Value
Array of moves which represent the path found to solve the puzzle
(<i>type=[Move]</i>)

Inherited from object

`--delattr--()`, `--format--()`, `--getattribute--()`, `--hash--()`, `--new--()`, `--reduce--()`, `--reduce_ex--()`,
`--repr--()`, `--setattr--()`, `--sizeof--()`, `--str--()`, `--subclasshook--()`

12.2.2 Properties

Name	Description
<i>Inherited from object</i>	
<code>--class--</code>	

13 Module `UnBlockMeSolver.PathFinder.Solver`

13.1 Variables

Name	Description
<code>--package--</code>	Value: None

14 Module `UnBlockMeSolver.PathFinder.TreeSearch`

14.1 Variables

Name	Description
<code>__package__</code>	Value: <code>'UnBlockMeSolver.PathFinder'</code>

14.2 Class `TreeSearch`

object

`UnBlockMeSolver.PathFinder.PathFinder.PathFinder`

`UnBlockMeSolver.PathFinder.TreeSearch`

14.2.1 Methods

<code>__init__(self, board, bfs=True)</code>
Initialize <code>TreeSearch</code> class.
Parameters
<code>board</code>: Map to be solved (<i>type=Map</i>)
<code>bfs</code>: Whether this class will use breadth-first search or depth-first search (<i>type=boolean</i>)
Return Value
Initialized <code>TreeSearch</code> class (<i>type=TreeSearch</i>)
Overrides: <code>object.__init__</code>

populateQueue(*self*, *graph*, *move*, *queue*, *parent*)

Populate the queue with nodes and their cost.

Parameters

graph: Graph to get moves from to populate queue
(type=Map)

move: Move to get to the
(type=Move)

queue: Stack with nodes being added to it with the cost
(type=Queue)

parent: Parent for the nodes that will be created
(type=Node)

getPath(*self*)

Get the best path to solve the given graph.

Return Value

Array of moves which represent the path found to solve the puzzle
(type=[Move])

Overrides: *UnBlockMeSolver.PathFinder.PathFinder.PathFinder.getPath*

Inherited from object

__delattr__(), *__format__()*, *__getattr__()*, *__hash__()*, *__new__()*, *__reduce__()*, *__reduce_ex__()*,
__repr__(), *__setattr__()*, *__sizeof__()*, *__str__()*, *__subclasshook__()*

14.2.2 Properties

Name	Description
<i>Inherited from object</i>	
<i>__class__</i>	

15 Module UnblockMeSolver.PathFinder.bfs

15.1 Variables

Name	Description
<code>--package--</code>	Value: <code>'UnblockMeSolver.PathFinder'</code>

15.2 Class BFS

object 

UnblockMeSolver.PathFinder.PathFinder.PathFinder  UnblockMeSolver.PathFinder.bfs.BFS

15.2.1 Methods

getPath(self)

Get the best path to solve the given graph.

Return Value

Array of moves which represent the path found to solve the puzzle
(*type=[Move]*)

Overrides: UnblockMeSolver.PathFinder.PathFinder.PathFinder.getPath

populateQueue(self, graph, move, queue, parent)

Populate the queue with nodes and their cost.

Parameters

graph: Graph to get moves from to populate queue
(*type=Map*)

move: Move to get to the
(*type=Move*)

queue: Stack with nodes being added to it with the cost
(*type=Queue*)

parent: Parent for the nodes that will be created
(*type=Node*)

Inherited from UnBlockMeSolver.PathFinder.PathFinder.PathFinder(Section 12.2)

`__init__()`

16.1 Variables

Name	Description
<code>--package--</code>	Value: <code>'UnblockMeSolver.PathFinder'</code>

16.2 Class DFS

16.2.1 Methods

getPath(self)
Get the best path to solve the given graph.
Return Value
Array of moves which represent the path found to solve the puzzle (<i>type=[Move]</i>)
Overrides: UnblockMeSolver.PathFinder.PathFinder.PathFinder.getPath

populateQueue(self, graph, move, stack, parent)
Populate the stack with nodes and their cost.
Parameters
graph: Graph to get moves from to populate queue (<i>type=Map</i>)
move: Move to get to the (<i>type=Move</i>)
stack: Stack with nodes being added to it with the cost (<i>type=[Node]</i>)
parent: Parent for the nodes that will be created (<i>type=Node</i>)

Inherited from UnblockMeSolver.PathFinder.PathFinder.PathFinder(Section 12.2)

`__init__()`

Inherited from object

`__delattr__()`, `__format__()`, `__getattr__()`, `__hash__()`, `__new__()`, `__reduce__()`, `__reduce_ex__()`, `__repr__()`, `__setattr__()`, `__sizeof__()`, `__str__()`, `__subclasshook__()`

<code>--package--</code>	Value: None

19.2 Class Stack

19.2.1 Methods

`--init--`(*self*)

x.`--init--`(...) initializes *x*; see `help(type(x))` for signature

Overrides: `object.--init--` `exitit`(inherited documentation)

`put`(*self*, *obj*)

Put object into stack.

Parameters

obj: object to be placed into the stack

(*type=any type*)

`get`(*self*)

Gets the most recent item and pops it.

rtype: any type

Return Value

Object from stack that was popped.

empty(*self*)

Checks whether this stack is empty or not

Return Value

Stack is empty
